Work Done This Week

- We improved parts of our code and saved our model so we don't have to run it every time.
- We focused on improving efficiency, generalising the code based on our pipeline and trying to solve the challenges that we faced. We also tried to reduce computational cost and narrow down search space. We also improved evaluation process and refined metrics of coverage, fragmentation and ID's.
- We have also started working on documentation of final code

Our Learnings

- We understood the importance of reducing search space and how much actual difference it makes.
- Lastly we learned how the parameters we selected and their weights can affect the performance of tracklet selection.
- We learned how much code to include in documentation.

Challenges Faced

- Balance of computational efficiency and model performance.
- Designing good features for classifier and improving accuracy codes leading to decreasing accuracy.

Planning for Next Week

- Documentation
- Final testing with video and coding
